                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel cellulase isolated from an Actinomycete sp. which can be used in detergent compositions, as animal feeds (to increase nutritional value) and in treatment of textiles (e.g. stone washing or modifying texture, feel and/or appearance of cellulosic fabrics, including removal of 'immature' or 'dead' cotton), pulp (to improve draining) and paper. They may also be used as baking additives, for treating starch (in production of high-fructose corn syrup or ethanol) and for treating grain (to reduce fibre during milling).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 4;

The cellulase composition, as an additive for animal feed and for the treatment of textiles or pulp and paper. The DNA encoding the cellulase can be used to identify homologous cellulases and for recombinant production of cellulases. The present sequence represents DNA encoding a cellulase from Actinomycetes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         27620
The invention concerns collagen-like polymers having repetitive triads with reduced proline content, and where glycine is the initial amino acid and the subsequent amino acids are varied. The choice of triads utilised in a recombinant collagen-like polymer are chosen in order to affect properties such as helix stability, hydration, solubility, gel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         27500

Triads of particular interest include GAP, GPA, GPP, GAS, GPG, GPS, GAQ, GSP, GLQ, GPR, GAK, GAK, GAR, GER, GDR, GEP, GDA, GAH and GEA. The collagen-like polymers may impart new characteristics, finding wide used in photographic, medical, structural and fibre applications, and are capable of being produced in unicellular microorganisms at high mol. wts. and in high efficiency. Plasmid DNA from several colonies were analysed for inserts contg. multiple A6 DNA fragments by digestion with Fokl. The present sequence, was identified to contain the SequenceD gene 1 monomer sequence C2A24C2. The SequenceD collagen-like polymers are used as immunogens for the

Its protein is involved in the isoprenoid biosynthesis pathway. The cDNA was identified by sequencing a number of clones and then comparing their protein sequences to known proteins: this showed the sequence's similarity to the capsicum annuum DXPS sequence. The DXPS gene and protein can be used to create transgenic plants which express the gene at either different levels or at different stages of development compared to normal, and to identify herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 2; Page 67; 73pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequences given in AAQ43030-34 encode examples of recombinantly produced DCP collagen-like polymers (CLPs) which consist of repeated tripeptide sequences selected from a wide range of GXY sequences, where X and Y can be any amino acid. These sequences can be cloned into plasmids and used to transform E. coli to produce the DCP proteins. DCP peptides comprise repeated units of; A = GAPGPAGPP, B = GSRGDPGPP and/or C = GAHGPAGPF. These polymers may be used to raise anti-DCP antibodies in rabbits. These polymers have molecular weights of >30 kD and are able to form helices due to interchain linkages. These polymers prof. contain a proportion of tripeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Recombinant; collagen-like polymer; CLP; tripeptide; helix; membrane; fibre; film; coating; triad sequence; collagen; mammalian; moulding; hydrogel; interchain linkage; colloid suspension; DCP; antibody; ds.

                         This sequence encodes an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                            Tuberculosis; immunogenic; soluble; antigen; py vaccine; pharmaceutical; infection; diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's. DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tuberculosis. Ag can induce proliferation of, or cytokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AAZ19249 to AAZ19460 and AAY39083 to AAY39225 are used in the exemplification of the present invention.

                                                                                                                                                    This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as

combinatorial biosynthesis to generate libraries of orthomycins, e.g. everninomicin analogues/homologues and drug discovery. The DNA encoding the integrase allows for increasing a given gene dosage. The integrative vector can be used to permanently integrate copies of a heterologous gene of choice into-chromosomes of different hosts and to integrate genes which increase the yield of known products or to generate novel products such as hybrid antibiotics or other novel secondary metabolites. The vector can also be used to integrate antibiotic
                                                                                                                                                                                                                         useful for synthesising novel everninomicin-related compounds, arising from modifications of the DNA sequence designed to change glycosyl and modified orsellinic acid groups contained in everninomicin, for expressing functional or mutant everninomicin blosynthetic enzyme for evaluation, diagnosis and preferably biosynthesis of everninomicin or other secondary metabolic products, improving the yield of everninomicins and to produce novel everninomicins and also as a hybridisation probe to identify homologous sequences. The encoded polypeptides are useful for combinatorial biographics to control the product of the p
                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence encodes 11 proteins comprising enzymes of the everninomicin antibiotic biosynthetic pathway. A vector comprising a M. carbonacea everninomicin biosynthetic pathway resistance gene product is useful for selecting for a transfected or transformed host cell. An integrative version of the vector is useful for introducting a everninomicin pathway gene (a bottle-neck gene) into an actinomycete of the genus Micromonospora. The DNA encoding the biosynthetic proteins is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid molecules encoding everninomicin pathway gene products, useful for improving yields of everninomicin, to proverninomicin and as probes to identify homologous sequences -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, Mycobacterium tuberculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CCC 1551 (AAI99683) and H37Rv (AAI99682). The method is useful for evaluating strain variation of M. tuberculosis and has valuable application in the fields of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim

                                                                                                                                                                                                                                                                                                                                                                                              in frenolicin synthesis. The genes can be divided into 5 subclusters: (1) genes A, B, C, D and F encode an efflux pump; (2) genes H, I, J and K encode butyrate starter synthases; (3) genes L, M and N encode polyketide synthases (PKS); (4) genes O, P, Q and R encode a hemiketalase, a ketoreductase and cyclases/dehydrases; and (5) genes S and T encode a keto/enoyl reductase and a hydrolase. Also claimed are vectors, host cells (especially a Streptomyces sp., particularly Streptomyces roseofulvus), and the encoded proteins. Cells transformed using the above sequence can be cultured to produce frenolicins or frenolicin precursors. The precursors can be converted to frenolicins by chemical or other methods. The frenolicins can be oxidised to frenolicin B, an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sgo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This DNA sequence comprises the Streptomyces frenolicin gene cluster containing specifically claimed coding sequences (genes A-U) that respectively encode 21 proteins (see AAW34199-219) involved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CDS
